Collected Knowledge & Wisdom on

# Anagramica Anagram API

---

## Provides:

This API provides all possible anagrams of a given word.

### Key Provisioning:                                    **Pain factor** (*0=ezpz...5=nightmare*): <mark>0</mark>

- No key required

### Quotas:

- No quotas?

---

## The Good:

- Works exactly as you'd expect it to. Returns all the anagrams possible in the word
- Two modes, best and all: best returns all anagrams using all the letters of the word and all returns all possible anagrams.
- Doesn't break if you put a number in by accident

## The Bad:

- There's a lookup feature but I don't think that it works
- Breaks if the word is too long (10 letters or more)

## The Ugly:

- When using the all function, its returns include single letters and two letter combinations that make no sense
